ParticleSystemSortingLayerEditor.....	2
ParticleSystemEmissionMultiplier.....	3

Overview

This module includes some helper script for easy multi editing of specific particle system values

ParticleSystemSortingLayerEditor

This script is used to bulk edit sorting layer IDs of particle systems, which can be very useful for reducing batch draw calls when working with particle effects that use meshes.

In many VFX assets, meshes are grouped using the Order In Layer value of the particle system renderer. However, Unity can only batch meshes efficiently if each mesh has a distinct sorting configuration. You can either assign unique order values for every mesh manually, or use this script to move them into dedicated sorting layers without managing order values yourself.

To use the tool, navigate to:

Tools → SF Studio → Particle System Utils → Sorting Layer Editor

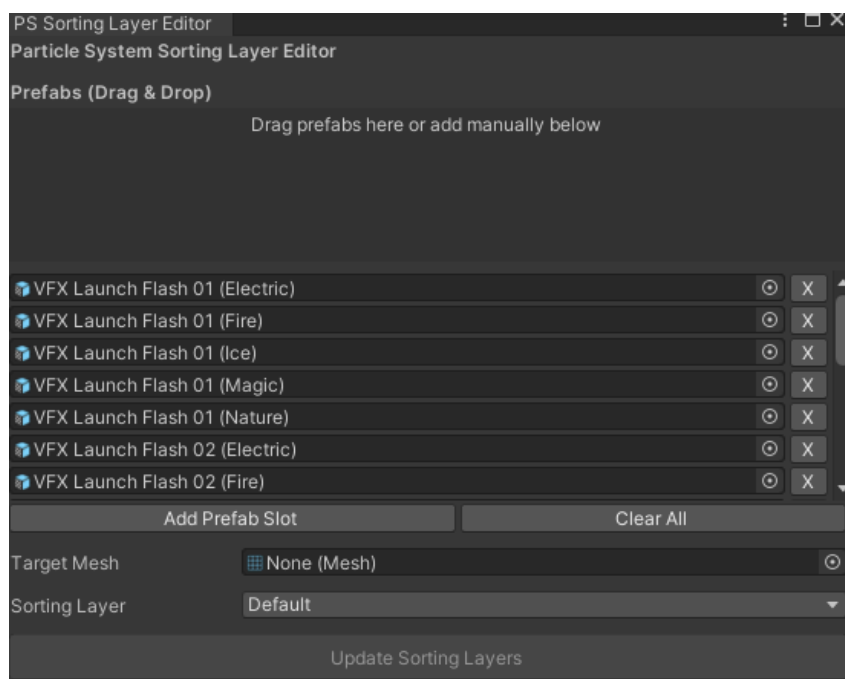

Then follow these steps:

Drag and drop all relevant particle system prefabs into the editor.

Select the mesh you want to filter for.

Choose the sorting layer that should be assigned to all particle systems using that mesh.

This workflow keeps your setup clean and scalable while helping Unity batch particle meshes more efficiently.

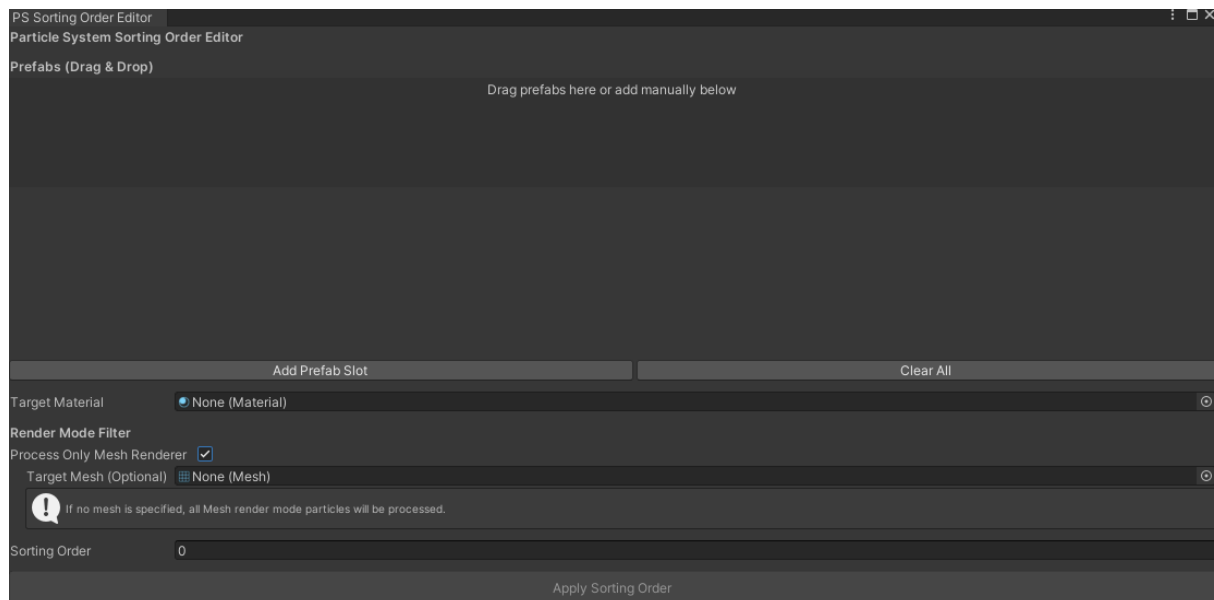

ParticleSystemSortingOrderEditor

This editor script helps improve performance across multiple VFX assets by allowing you to bulk edit the sorting order of particle systems. It is especially useful when optimizing batch calls for large effect libraries.

The editor lets you drag and drop multiple VFX prefabs, select a target material, and define the sorting order that should be applied to particle systems using that material.

By default, particle systems that use Mesh as their render mode are skipped. To include mesh based particle systems, enable the Process Only Mesh Renderer option.

You can also optionally specify a mesh to target. If a mesh is selected, only particle systems using that mesh will have their sorting order updated. If no mesh is specified, all particle systems that use Mesh as their render mode will be updated, regardless of the assigned mesh.

ParticleSystemEmissionMultiplier

Note: This script assumes that your particle systems use a custom vertex stream shader, allowing emission values to be controlled individually per particle system.

Depending on the selected render pipeline, you may want to adjust emission strengths. For example, HDRP typically supports much higher emission values. This helper script makes it easy to bulk adjust particle emissions by applying a single multiplier value. All child particle systems are processed automatically as well.

To use the tool, navigate to:

Tools → SF Studio → Particle System Utils → Emission Multiplier Editor

Then follow these steps:

Drag and drop all relevant particle system prefabs into the editor.

Enter a multiplier value for the emission.

Apply the multiplier to update all selected particle systems.
